

Oracle Enterprise Manager Ops Center 12c R2 Virtualizing Systems

Duration: 4 Days

What you will learn

The Oracle Enterprise Manager Ops Center 12c Virtualizing Systems course describes using Oracle Enterprise Manager Ops Center to manage Oracle VM Server for SPARC implementations, and provides hands on practices that augment your understanding of this virtualization technology.

Learn To:

Describe virtualization capabilities in Oracle Enterprise Manager Ops Center 12c.

Prepare a lab environment for OVMSS virtualization activities.

Create and manage storage libraries used to support OVMSS implementations.

Create and manage OVMSS servers, guests, and server pools.

Migrate OVMSS guests.

Build network infrastructures to support OVMSS clouds.

Manage I/O Domains.

Manage root domains.

Work with SR-IOV and Server Pools.

Create OVMSS Clouds.

Create OVMSS vServers.

Benefits To You

Benefit by getting an in-depth learning experience using EM Ops Center 12c software to manage Oracle VM Server for SPARC implementations. Explore the Ops Center software to create and manage OVMSS servers and OVMSS guest OS instances, create OVMSS clouds, and manage I/O domains. This course describes managing structures that support OVMSS implementations, including storage libraries and server pools.

Audience

Sales Consultants

System Administrator

Technical Administrator

Related Training

Required Prerequisites

General system administration skills related to system deployment, monitoring and software maintenance are required

Oracle Enterprise Manager Ops Center 12c Administration

Suggested Prerequisites

General Oracle Solaris administration

General network administration

General virtualization technology administration

Oracle Solaris 11 System Administration Ed 3

Course Objectives

Describe virtualization capabilities in Oracle Enterprise Manager Ops Center 12c

Prepare a lab environment for OVMSS virtualization activities

Create and manage storage libraries used to support OVMSS implementations

Create and manage OVMSS servers, guests, and server pools

Migrate OVMSS guests

Build network infrastructures to support OVMSS clouds

Create and use OVMSS clouds

Manage I/O Domains

Manage root domains

Work with SR-IOV and Server pools

Course Topics

Enterprise Manager Ops Center Virtualization Overview

About Virtualization and Hypervisors

Oracle Virtualization

Benefits of Virtualization in Enterprise Manager Ops Center

Supported Virtualization Technologies in Enterprise Manager Ops Center

Hardware for OVMSS

OVMSS Architecture

Preparing the Lab Environment

Enterprise Manager Ops Center Installation Overview

Preparing the Lab Environment, Gathering Required Information

Performing Preinstallation Checks

Installing Enterprise Manager Ops Center Software

Configuring the Enterprise Controller in Disconnected Mode

Creating a Discovery Profile for ILOM Service Processors

Discovering and Managing Service Processors Using the Add Assets Action

Creating a New Local Software Library

Managing Storage Libraries

Storage Library Overview

Creating a NAS Storage Library

Loading Images into a NAS Storage Library

Creating a SAN Storage Library

Adding LUNs to a SAN Storage Library

Associating a SAN Storage Library

Editing Library Attributes

Managing OVMSS Servers

About Oracle VM Server for SPARC

OVMSS Control Domain Provisioning

OVMSS Server Management

Managing OVMSS Guest

OVMSS Guest Management

Creating a Logical Domain Profile

Creating an OS Provisioning Profile

Creating a Deployment Plan

Verifying and Associating Storage Libraries

Creating and Provisioning Logical Domains

Guest Management and Monitoring

Creating and Managing Server Pools

About Server Pools

Creating a Server Pool

Server Pool Management

Creating Guests in a Server Pool

OVMSS Guest Management Actions

Migrating OVMSS Guests

Migrating Guests in Server Pools

Configuring Load Balancing for Server Pools

Manually Load Balancing Server Pools

Working with Networks

Enterprise Manager Ops Center Clouds

Steps for Implementing Static Private vNets and Public vNets in Clouds

Plumbing Networks Manually

Enabling DHCP on Proxy Controllers

Defining Managed IP Ranges on Networks

Assigning Networks to Server Pools

Creating Network Domains

Associating Network Domains with Server Pools

Creating OVMSS Clouds

Tasks for Cloud Administrators and Cloud Users

Creating Virtual Data Centers

Creating Accounts

Creating Server Templates

Creating Private vNets
Allocating Public or Private IP Addresses

Creating vServers

Overview
Procedure

Creating I/O Domains

About I/O Domains
Creating I/O Domains with PCIe Endpoint Devices
Creating Root Domains
Attaching Networks (Non-SR-IOV)
Creating I/O Domains with Virtual Functions
Working with Server Pools

Creating Root Domains

Working on SR-IOV and Server Pools
