

Data Modelling and Design

Course Contents

Lesson 01: Introduction to Modeling

- Introduction to Modeling
- Why Model?
- Project Phases and Model Transitions
- Function Model Terminology

Lesson 02: Create the Entity-Relationship Model

- Create the Entity-Relationship Model
- Identifying Entities
- Identifying Relationships
- Relationship Types
- Uniquely Identifying Entity Instances
- Refactoring Attributes as Entities
- Supertype - Subtype Entities
- Validating Unique Identifiers
- Master-Detail, Classification, and Basket Patterns

Lesson 03: Normalization

- Normalization
- Relational Database Principles
- ONF to 1NF Transition

Lesson 04: Design and Implement Data Models

- Design and Implement Data Models
- From Analysis to Design to Implementation
- Entity to Table Model Transition
- Single Table Subtype-Supertype Implementation
- Denormalization
- Entity to Unified Modeling Language (UML) Class Model Transition
