

DP-080T00: Querying Data with Microsoft Transact-SQL

Course Duration: 16 Hours (2 Days)

Overview

The DP-080T00: Querying data with Microsoft Transact-SQL course is an essential training program for professionals who aim to master MS Transact-SQL for querying, modifying, and Managing data within Microsoft SQL Server databases. It covers foundational skills in using T-SQL, starting with basic SELECT statements and advancing through complex operations like Joins and subqueries. Module 1 introduces T-SQL and the tools for writing queries, while Module 2 delves into sorting and Filtering data. Module 3 teaches learners how to craft sophisticated queries using Joins and Subqueries. Module 4 focuses on leveraging Built-in functions to perform calculations and Data transformations. Finally, Module 5 covers Data modification techniques. By completing this course, participants will gain a solid understanding of Querying data with Microsoft Transact-SQL, which is pivotal for database management and analytics roles. The course equips learners with practical skills to efficiently query and manipulate data, thereby supporting business intelligence and data-driven decisions.

Audience Profile

The DP-080T00 course equips professionals with essential skills for querying data using Microsoft Transact-SQL, a key tool for database management.

- Target audience for the course includes:
- Database Administrators
- Database Developers
- Data Analysts
- BI Professionals
- SQL Server Power Users
- IT Professionals who work with SQL databases
- Data Scientists who need to manipulate SQL Server data
- Report Writers
- System Engineers who manage and maintain SQL Server databases
- Aspiring individuals aiming for a career in data management or related fields

Course Syllabus

Module 1: Getting Started with Transact-SQL

In this module you will learn about the basics of the Transact-SQL (T-SQL) language, as well as general properties and terminology of relational databases. This module will also introduce the basic SELECT statement for retrieving data from a table.

Lessons

- Introduction to Transact-SQL
- Using the SELECT statement

Lab: Get started with SQL Server query tools and writing queries in T-SQL

- After completing this module, students will be able to:
- Using a query tool to write and execute queries in Transact-SQL
- Understand the basic concepts of relational database and the T-SQL language
- Write SELECT statements to retrieve data from a relational database table
- Understand basic datatypes and how they are used
- Understand the basics of NULL values

Module 2: Sorting and Filtering Query Results

In the module you will learn how to control what data is returned, the order in which it is returned. You will use the ORDER BY clause, with and without paging. You will learn about various kinds of filters that can be used in the WHERE clause to control which data rows are returned. You will also learn how to manage the results by removing duplicates with DISTINCT.

Lessons

- Sorting query results
- Filtering the data

Lab: Sort and filter data returned by SELECT queries

- After completing this module, students will be able to:
- Use ORDER BY to sort results from a T-SQL SELECT statement
- Add a TOP clause to limit the ordered rows returned
- Page the sorted data with OFFSET-FET
- Write WHERE clauses to filter the rows returned
- Use DISTINCT to eliminate duplicate rows in the results

Module 3: Using Joins and Subqueries

In this module, you will explore T-SQL queries which access data from multiple tables with various kinds of JOIN operations and simple subqueries.

Lessons

- Using JOIN operations
- Using subqueries

Lab: Write queries with JOIN operations

Lab: Write SELECT statements using subqueries

- After completing this module, students will be able to:
- Write queries accessing data from multiple tables using JOIN operations
- Understand the differences between type of JOIN operations: INNER JOIN, OUTER JOIN, CROSS JOIN
- Understand how to join a table to itself with a self-join
- Write subqueries within a SELECT statement
- Understand the difference between scalar and multi-valued subqueries
- Understand the difference between correlated and self-contained subqueries

Module 4: Using Built-in Functions

- In the module you will explore the use of built-in functions for returning computed or special values in the SELECT list or in the WHERE clause. Functions include math functions, string

functions and system functions. There are other types of functions that will be mentioned, but not discussed in detail. You will also learn how to

- combine rows of data into a single group, providing summary information for the group such as SUM, MIN or MAX.

Lessons

- Getting started with scalar functions
- Grouping aggregated results

Lab: Built-in functions

- After completing this module, students will be able to:
- Write queries using scalar functions
- Write queries using aggregate functions
- Use GROUP BY to combine data into groups based on a common column value
- Understand how HAVING is used to filter groups of rows

Module 5: Modifying Data

In this module, you will learn the T-SQL statements for modifying table data including UPDATE, DELETE and MERGE as well as various options for INSERT including creating a new table with data from an existing table. You will also look at how to have the system automatically supply values for columns as the data is inserted.

Lessons

- Inserting data into tables
- Modifying and deleting data
